

Capital360 Investify

Whitepaper

Sep 20, 2020

Abstract. Capital360 Investify is a forex signal service and automated investment management platform that gives everyday investors structured access to professionally-informed trading activity. Rather than requiring users to trade manually, the platform lets members fund an account, select a fixed-term investment plan, and receive profit credited automatically to their balance on a set schedule — backed by identity verification, two-factor authentication, and a full audit trail. This whitepaper describes the problem Capital360 Investify addresses, how the platform works end to end, its current investment plans, its security model, and the risks every prospective investor should understand before participating.

1. Introduction

Retail interest in forex and digital-asset investing has grown steadily, driven by easier account access, round-the-clock markets, and the appeal of returns that outpace traditional savings products. At the same time, most retail participants lack the time, expertise, or market access to trade effectively on their own, and the signal-selling and "managed account" space is crowded with services that are opaque about how returns are generated or credited.

Capital360 Investify was built to close that gap: a platform where members fund an account, choose a plan that matches their risk appetite and capital, and let the platform's trading activity generate returns that are credited to their balance automatically and on a transparent schedule — with every deposit, profit credit, and withdrawal visible in the user's own transaction history.

2. The Problem

Investors exploring forex signal services and managed investment products typically run into the same set of problems:

- **Unreliable or unverifiable signals.** Many signal providers offer no track record and no accountability for poor calls.

- **Opaque return calculation.** Returns are often described vaguely ("up to X%"), with no clear schedule for when or how profit is actually credited.
- **Slow, manual payouts.** Withdrawals and profit distributions frequently depend on a human reviewing and approving each request, creating delays and uncertainty.
- **Weak account security.** Platforms in this space are a common target for account takeover, and many offer little beyond a password to protect user funds.
- **No audit trail.** Users are often unable to see a clear, timestamped history of how their balance changed over time.

Capital360 Investify was designed specifically to address each of these points.

3. The Capital360 Investify Solution

Capital360 Investify combines two functions in a single account:

1. **A forex signal service**, providing trade signals and market activity that inform the platform's trading approach.
2. **An automated investment management system**, where members deposit funds, choose a fixed-term plan, and have profit credited to their account balance automatically rather than through manual, case-by-case payouts.

The platform is built around transparency at every step: users see their deposit confirm, their plan activate, each profit credit land in their transaction history, and their withdrawal process through to completion — all from their own dashboard.

4. How It Works

1. **Create an account.** Users register and complete KYC (Know Your Customer) identity verification, which is required before funds can be withdrawn.
2. **Fund the account.** Deposits are supported via major cryptocurrencies (Bitcoin, Ethereum, Litecoin, USDT) and bank transfer. For crypto deposits, the platform displays the destination wallet address as both text and a scannable QR code, with a 30-minute window to complete the transfer before the payment session expires.
3. **Choose an investment plan.** Each plan has a defined minimum investment amount, duration, and expected return range (see Section 5).

4. Automatic profit crediting. Once a plan is active, profit is credited directly to the user's account balance on a fixed schedule (twice daily on current plans) for the life of the plan — with no manual request required. Every credit is recorded in the user's transaction history.

5. Withdraw funds. Withdrawals are protected by one-time passcode (OTP) verification and are subject to the minimum/maximum limits and any applicable charges set for the chosen withdrawal method.

5. Investment Plans

As of this writing, Capital360 Investify offers the following plans. All three run for 1 month and credit profit twice daily.

Plan	Minimum Investment	Duration	Headline ROI	Return Range	Sign-up Bonus
Starter	\$250	1 month	12%	10% – 15%	\$150
Growth	\$5,000	1 month	23%	20% – 25%	\$4,000
Ultimate	\$25,000	1 month	27%	25% – 30%	\$1,000

Additional plans may be available on the live platform beyond those listed here — see the current plan list in your dashboard for the full, up-to-date offering.

6. Security & Trust

- **Identity verification (KYC).** Users verify their identity before funds can be withdrawn, reducing fraud and unauthorized account use.
- **OTP-protected withdrawals.** Withdrawal requests require a one-time passcode, preventing a compromised password alone from being enough to move funds out.
- **Two-factor authentication.** Account-level 2FA is available to add a second layer of login protection.
- **Full activity logging.** Account changes and administrative actions are logged, creating an auditable record of activity on the platform.
- **Controlled profit crediting.** Automated profit crediting runs on a monitored schedule that can be paused platform-wide if needed, rather than running as an unsupervised black box.

7. Referral Program

Members can invite others to the platform using a personal referral link. When a referred user earns profit on an active investment plan, the referring member earns a commission calculated from that profit. This aligns incentives between the platform and its members: referral rewards grow alongside real returns earned by referred users, rather than being paid simply for sign-ups.

8. Risk Disclosure

Important: please read before investing. Returns described in this document, including the ROI figures in Section 5, are not guaranteed. Past or displayed performance does not indicate future results. Forex and digital-asset markets are volatile, and invested capital can be partially or fully lost. This whitepaper is provided for informational purposes only and does not constitute financial, investment, legal, or tax advice. Prospective investors should carefully consider their own financial situation and risk tolerance, and are encouraged to seek independent professional advice before committing funds to any investment plan.

9. Roadmap

Capital360 Investify's near-term development priorities are focused on expanding the platform's reach and capability:

Priority	Focus
Near-term	Expand supported cryptocurrency deposit/withdrawal options beyond BTC, ETH, LTC, and USDT
Near-term	Broaden two-factor authentication coverage and add further account-security tooling
Mid-term	Launch dedicated iOS and Android apps alongside the existing web dashboard
Mid-term	Introduce additional investment plan tiers and durations for greater flexibility

Priority	Focus
Ongoing	Grow the referral program and expand platform-wide reporting and transparency tools

This is a directional roadmap and is subject to change as the platform grows; it does not represent a guaranteed delivery schedule.

10. Team & Company Information

Capital360 Investify is operated by a team with a background in financial technology, forex markets, and platform security. The team's focus is on building a transparent, automated investment experience: reliable profit crediting, verifiable transaction history, and account protections (KYC, OTP, two-factor authentication) that are often missing from similar platforms.

Detailed individual leadership bios will be published here as the company's public profile grows.
